

Gold Sodium Thiosulfate

What is it?

Gold is a metallic element used in metal objects or dissolved in solutions. Its most common use is in jewelry.

GOLD SODIUM THIOSULFATE can also be known as:

- Sodium aurothiosulfate
- Thiochrysine
- Gold

Some Possible Uses of GOLD SODIUM THIOSULFATE / Where it might be found:

- Jewelry: watches, rings, necklaces, bracelets, earrings, piercing studs, pin or brooch
- Glasses frames
- Buckle or clasp
- Cosmetic case
- Key chain or fob
- Mirror
- Picture frame
- Pill case
- Gold coins
- Gold medal, statue, crown
- Bookbinding gold leaf
- Thread in embroidery
- Dental appliances, bridge
- Dental crown, prostheses
- Implanted medical devices
- Ceramic paint and enamel
- Cranberry glass
- Reflective layer in CDs
- Electronic circuits
- Gold solder
- Electrical wiring, contacts

- Protective coating in aircraft
- Coating in electron microscopy
- Toners for photography
- Biological research
- Materials science research
- Therapy for certain diseases
- Gold leaf or foil on chocolates
- Gold leaf on baked goods
- Goldschlager alcohol

Other products that might react like GOLD SODIUM THIOSULFATE:

- Potassium dicyanoaurate
- Gold chloride
- Gold aspartate
- Gold glutamate
- Gold acetylmethionate
- White gold
- Rose gold

What should I do to avoid GOLD SODIUM THIOSULFATE?

Gold allergy may show up in areas where gold is directly touching the skin.

Gold allergy may show up as a rash on the eyelids, face, or bridge of the nose. A rash may appear if you use a product on your face that contains the ingredients titanium or zinc. This is because titanium and zinc make it easier for gold to be released from jewelry. The type of jewelry includes gold watches, rings, necklaces, bracelets, and earrings. When the gold jewelry you are wearing comes near your face, titanium and zinc may release gold from the jewelry. This may cause you to get a rash in these areas because of the gold that is released. Titanium and

Gold Sodium Thiosulfate

zinc may be present in products like sunscreens, make-up, and eye shadow. The CAMP app does not automatically exclude titanium and zinc when there is a gold allergy.

Gold dental work may rarely produce mouth sores / lichen planus alongside where the metal is touching your mouth.

To avoid gold, select jewelry and glasses frames made of other metals, such as sterling silver or platinum. Solid copper, stainless steel, pewter, bronze, titanium, and brass are other alternatives. If a certain piece of gold jewelry must be worn, consult your jeweler about plating the item with rhodium or platinum. Ask about the expected cost and required frequency of re-plating.

If you are allergic to gold, you may need to avoid gold dental work and medical implants containing gold. It is best to discuss whether this is needed with your medical provider.

For possible workplace exposure, check the complete ingredient list of each item encountered to look for gold or one of its other names listed above. Wear clean protective gloves if it is necessary to handle gold at work.

In addition, the ACDS Contact Allergen Management Program® (CAMP®) can help manage contact dermatitis. It helps to find products that are safe to use by creating a list of products that do not contain one's allergens. For more information about CAMP®, please ask your doctor or visit www.contactderm.org.
