

Amerchol-L 101 / Lanolin

What is it?

Lanolin is a fat-like substance secreted by sheep oil glands. It helps to repel water from wool.

It has moisturizing properties. Thus, it is in many creams and ointments, lip products, cosmetics, and nipple products.

AMERCHOL-L 101 / LANOLIN can also be known as:

Amerchol, wool wax alcohols, wool alcohols, anhydrous lanolin, wool fat, wool wax, wool grease C, learlin, glossylan, golden dawn, hychol, nodorian, sparklelan, adeps lanae anhydrous, aloholes lanae, cosmetic lanolin, Emery 1650 and 1656, five star lanolin anhydrous USP, Ivarlan (3000, 3001, 3006), pharmaceutical lanolin, prime cosmetic lanolin, super corona lanolin, superfine lanolin, ultra fine lanolin

Names for modified LANOLIN:

- Lanolin Acid

Amerchol-L 101 / Lanolin

What should I do to avoid AMERCHOL-L 101 / LANOLIN?

Avoid using items that have lanolin. Brands such as Eucerin, Aquaphor, and Bag Balm frequently have lanolin as a main ingredient. Therefore, they should be avoided. Plain petroleum jelly (Vaseline or generic) will not have lanolin and can be used.

It is important to inspect the label of each product you use to find the complete ingredient list. If lanolin is present, one of its names listed above should appear in the ingredients. You should not use that product. If no ingredient list is present, you can go to the store and inspect the original box or package.

Some products' ingredient lists are available on the internet at the manufacturer's or store's website.

To find a workplace exposure, check with your safety officer to find items that may have lanolin.

Ask your doctor and pharmacist to check the ingredients of the medications you use for your skin to be sure there is no lanolin present.

Ask your hairdresser, barber, masseuse, wound care specialist, and nurse to avoid using lanolin in your care. If you must come in contact with lanolin as you care for others, wear gloves made of rubber, nitrile, or vinyl.

OTHER:

The content of lanolin varies. It may include lanolin sterols, fatty alcohols, and fatty acids. It is often processed by acetylation, dewaxing, and hydrogenation, so that lanolin becomes a complex mixture. Thus, a person may *tolerate* one type of lanolin but *react* to another.

Note- some people may not react to lanolin on normal skin, and may only react to lanolin on areas of rash.

In addition, the ACDS Contact Allergen Management Program® (CAMP®) can help manage contact dermatitis. It helps to find products that are safe to use by creating a list of products that do not contain one's allergens. For more information about CAMP®, please ask your doctor or visit www.contactderm.org.
